DOCUMENT-IDENTIFIER: US 5276013 A

TITLE: Conjugates of biologically stable polyfunctional molecules and polynucleotides for treating systemic lupus erythematosus

CLAIMS:

33. A method for making the conjugate of claim 2 comprising:

(a) bonding a multiplicity of single-stranded polynucleotides of at least about 20 base pairs each, each of which has a reactive functional group at or proximate one of its termini with functional groups on the polymer to form a conjugate; and

(b) annealing complementary single-stranded polynucleotides to the single-stranded polynucleotides conjugated to the polymer to form said duplexes.
